Case studies in insurance, healthcare, banking, retail and regulatory analytics

Professional Profile

I am developing my Business Analyst practice through end-to-end case studies and self-directed data projects across insurance, healthcare, banking and retail — combining business-case development and gap analysis with hands-on SQL, Excel and Power BI work. Each project runs the full analysis lifecycle: requirements, business case, data preparation, and the analysis or dashboard that would support a real decision.

This portfolio brings together ten pieces of work: a full investment business case for a health insurer's claims platform, a cloud migration gap analysis and roadmap for a retail bank, four Power BI dashboard builds across insurance, healthcare, e-cigarette regulatory analytics and retail operations, two SQL- and Excel-based data analyses for a bike-gear retailer and a UK gym chain, and two further SQL analyses — a coffee shop sales study and a retail orders/departments exercise — written directly in PostgreSQL. The Apex Health Insurance and Ham Trust Bank projects are structured training case studies; the Power BI, Excel and SQL projects are self-directed analyses I built independently on public datasets.

Business Change Analyst

Case study — Apex Health Insurance claims platform business case

BI / Dashboard Developer

Practice project — Power BI report design across 4 sectors

Data Analyst

Practice project — Excel-based sales & retention analysis

Gap Analysis Consultant

Case study — Ham Trust Bank cloud migration gap analysis & roadmap

Skills & Methods Demonstrated in This Portfolio

Requirements Elicitation

Stakeholder workshops, process mapping, documented business & functional requirements

Business Case Development

Options analysis, SWOT, cost-benefit analysis, financial metrics, recommendation

Power BI Dashboard Design

Multi-page report architecture, KPI cards, DAX-driven visuals, drill-through

Data Analysis (Excel & SQL)

Power Query & SQL data cleaning, pivot tables, trend and segmentation analysis on 100k+ row datasets

Stakeholder Management

Stakeholder registers, RACI matrices, communication planning

Gap & Risk Analysis

Current vs. future state mapping, SWOT / Fishbone / PESTLE / McKinsey 7S, risk registers, mitigation planning

Agile Delivery

Scrum-based delivery planning, sprint-aligned milestone tracking

Regulatory & Compliance Awareness

HIPAA, data privacy and FDA PMTA-aligned reporting

Portfolio at a Glance

Project	Industry	My Role	Tools
Apex Health Insurance — Claims Platform Business Case (Case Study)	Health Insurance	Business Change Analyst — authored the business case	Business case, SWOT, CBA
Insurance Policy Sales and Revenue Performance Dashboard	Insurance	BI Developer — designed 5-page report	Power BI
Healthcare Patient Admissions Dashboard	Healthcare	BI Developer — designed operational report	Power BI
E-Cigarette Market & Regulatory Dashboard	Consumer / Regulatory	BI Developer — designed 4-page report	Power BI
Retail & Grocery Operations Dashboard	Retail	BI Developer — designed 4-page report	Power BI
Global Sporting Goods Sales Performance Analysis	Retail (Sporting Goods)	Data Analyst — 113k-row sales analysis	SQL, Excel, PivotTables
UK Gym Membership Retention Analysis	Leisure / Fitness	Data Analyst — retention & churn analysis	Excel
Banking Cloud Migration Gap Analysis (Case Study)	Banking / Financial Services	Business Analyst — led the full gap analysis & roadmap	SWOT, Fishbone, PESTLE, McKinsey 7S
Coffee Shop Sales Analysis	Food & Beverage / Retail	Data Analyst — 3,547-transaction SQL analysis	PostgreSQL
Retail Orders and Product SQL Analysis	Retail / Grocery	Data Analyst — ad-hoc business-question queries	PostgreSQL

Apex Health Insurance: Claims Management Platform

Background

Apex Health Insurance is a fictional company used for this training case study. It's a fast-growing U.S. health insurer serving over 6 million members across 18 states, where separate, disconnected systems for Customer Service, Claims Operations, Medical Review, Fraud Investigation and Finance created fragmented workflows, duplicate work and poor end-to-end claims visibility. I took on the role of Business Analyst for this engagement.

The Business Problem

- Employees switch between several disconnected applications to process a single claim
- Manual processes push average claim processing time to 18 business days
- Manual compliance checks increase regulatory and audit risk
- Inconsistent claims handling across regional offices
- Managers have limited real-time visibility into claims and team performance

18 business days

average claim processing time under the current legacy environment

6M+ members

across 18 U.S. states, served through 5+ siloed legacy systems

My role in this case study

Business Change Analyst — authored the full business case: strategic case, options analysis, SWOT, cost-benefit analysis and delivery plan.

Recommended Solution & Financial Case

Recommended Option

Replace the disconnected legacy systems with a single, cloud-based Claims Management Platform: automated claims processing, standardized workflows across regions, real-time dashboards, and closer collaboration between internal teams and external healthcare providers.

My role in this case study

- Elicited and documented business requirements through stakeholder workshops
- Facilitated process mapping across Claims, Finance, Fraud and Medical Review teams
- Built the options analysis, SWOT and cost-benefit case for the Steering Committee
- Authored the stakeholder register, RACI matrix, communication plan and gap analysis
- Defined the delivery approach (Agile/Scrum) and supported UAT planning

£4.7M

estimated implementation investment

£5.7M

projected annual business benefit

29 weeks

Agile delivery timeline to go-live

Stakeholder Register

Apex Health Insurance (case study) — Claims Management Platform

Stakeholder	Role	Interest	Influence	Engagement Approach
Chief Operating Officer	Executive Sponsor	High	High	Monthly steering committee briefings
Director of Claims Operations	Project Sponsor	High	High	Weekly updates, deliverable sign-off
Steering Committee	Governance Body	High	High	Monthly meetings, stage-gate approvals
Project Manager	Delivery Lead	High	High	Daily stand-ups, status reporting
Business Analyst (Self)	Requirements & Change	High	Medium	Weekly workshops via MS Teams
IT Manager	Systems Integration Lead	Medium	High	Integration testing, deployment notices
Change Manager	Adoption & Training Lead	Medium	High	Training & go-live communications
Compliance Manager	Regulatory Owner	Medium	High	Compliance checkpoint reviews
End Users (Claims Staff)	Operational Users	High	Low-Medium	Training sessions, LMS, email updates

RACI Matrix

Apex Health Insurance (case study) — Claims Management Platform · R = Responsible, A = Accountable, C = Consulted, I = Informed

Activity	Sponsor	PM	BA	IT Mgr	Change Mgr	Compliance Mgr
Business Case & Funding Approval	A	C	C	I	I	I
Requirements & Process Mapping	I	A	R	C	I	C
Solution Design & Sprint Planning	I	A	C	R	I	C
Data Migration & System Testing	I	A	C	R	I	C
UAT & Quality Assurance	I	A	R	C	I	C
Training & Change Management	I	A	C	I	R	I
Go-Live & Deployment	I	R	C	R	C	I
Post-Implementation Benefits Review	A	R	R	I	I	I

Communication Plan

Apex Health Insurance (case study) — Claims Management Platform

Information	Audience	Method / Channel	Frequency	Owner
Project Status Report	Executive Sponsor & Steering Committee	Steering Committee Meeting / Email	Monthly	Project Manager
Sprint Progress	Project Team	Daily Stand-up Meeting	Daily	Project Manager
Requirements Updates	Business Stakeholders	Workshops / MS Teams	Weekly	Business Analyst
Risk & Issue Report	Project Sponsor & Steering Committee	Risk Register Review Meeting	Fortnightly	Project Manager
Training & Go-Live Updates	End Users	Email, LMS, Training Sessions	Before Go-Live	Change Manager
Deployment Notifications	All Stakeholders	Email & MS Teams	As Required	IT Manager

As the Business Analyst in this case study, I owned the weekly requirements-update cadence with business stakeholders and contributed the underlying content for status and risk reporting.

Gap Analysis — Current vs. Future State

Apex Health Insurance (case study) — Claims Management Platform

Area	Current State	Future State	Gap / Action Required
Claims Processing	18 business days, manual multi-system handling	Automated end-to-end processing	Implement workflow automation & real-time tracking
Systems Landscape	5+ disconnected legacy systems	Single integrated Claims Platform	System consolidation & phased data migration
Reporting & Visibility	No real-time visibility, siloed data	Real-time dashboards & KPI reporting	Build BI layer (processing time, fraud, CSAT)
Compliance	Manual compliance checks, audit risk	Automated validation & audit trails	Embed compliance workflows & access controls
Regional Consistency	Inconsistent handling across regions	Standardized nationwide workflows	Define & roll out standard process templates
Customer Experience	Declining CSAT, complaints from delays	CSAT target of 90%+	Faster, transparent claims + self-service tracking
Operating Costs	Rising operational & maintenance costs	£2M annual savings target	Retire legacy systems, automate manual tasks

Insurance Policy Sales and Revenue Performance Dashboard

Objective

Insurance sales leadership had no single view of policy revenue, premium trends, product mix or campaign performance — each lived in a different export, so an underperforming product or region could go unnoticed until the quarterly review. I built an interactive 5-page Power BI report giving leadership and regional managers one place to spot shifts early and act within the quarter.

My Role

- Designed the 5-page information architecture: Executive, Sales & Revenue, Product Performance, Marketing Campaign, Customer & Geographic
- Selected chart types matched to each audience — KPI cards, trend lines, category bars, geographic breakdowns
- Built interactive slicers for date, product and region-level filtering

Key Visuals (Executive Page)

Revenue & Premium trend (line) • Revenue by Product Type & City (bar) • City by Product Mix (donut) • 5 KPI summary cards

Executive Dashboard page — layout reconstructed from the Power BI report structure

Healthcare Patient Admissions Dashboard

Objective

Hospital operations and clinical leadership tracked admissions, diagnosis mix and treatment outcomes through static exports, making it hard to see which units were under strain in real time. I built a report with drill-through to patient-level detail so leaders could investigate an emerging issue the same day it appeared, not weeks later in a retrospective review.

My Role

- Designed a summary + detail structure: an Overview page for trends and KPIs, and a Patient Page for record-level drill-through
- Built visuals for admissions by primary diagnosis and % outcome status
- Applied action-button navigation between the summary and detail views

Key Visuals (Executive Page)

Admissions by Primary Diagnosis (bar) • % Outcome Status (donut) • Admission trend (line) • 5 KPI cards • Patient-level detail table

Overview page — layout reconstructed from the Power BI report structure

E-Cigarette Market & Regulatory Dashboard

Objective

Commercial and regulatory-affairs teams tracked sales performance and FDA PMTA authorization status separately, so a strong-selling product could carry compliance risk without anyone noticing until an audit. I combined both views in one report, giving both teams a shared, real-time picture to catch that conflict before it became a compliance issue.

My Role

- Designed a 4-page navigation structure: Navigation, Executive Overview, Product & Consumer Insights, Regulatory & Risk Analysis
- Built visuals linking sales performance to FDA PMTA authorization status
- Bridged commercial reporting (top brands/states) with compliance reporting (authorized vs. non-authorized sales)

Key Visuals (Executive Page)

Top 10 Sales by State & by Brand • Sales by Product Type (donut) • Sales & FDA-authorized Sales by PMTA Status • 4 KPI cards

Executive Overview page — layout reconstructed from the Power BI report structure

Retail & Grocery Operations Dashboard

Objective

Merchandising and operations teams reviewed product, department and hourly transaction data through separate exports, making it slow to spot an underperforming product line or an inefficient staffing pattern. I built a Power BI report on large-scale, order-level transaction data so teams could act on merchandising and staffing decisions weekly instead of at quarter-end.

My Role

- Designed a 4-page structure: Navigate, Executive Overview, Product & Department Analysis, Customer Behaviour & Operations
- Built time-of-day and day-of-week operational analysis views
- Ranked top and worst-performing products by profit and quantity sold

Key Visuals (Executive Page)

Revenue Trend (line) • Revenue by Department (bar) • Orders by Hour of Day (column) • Top 10 Products by Profit • 5 KPI cards

Executive Overview page — layout reconstructed from the Power BI report structure

From Raw Exports to Analysis-Ready Data

Objective

Before any dashboard was built, each Power BI project (Insurance, Healthcare, E-Cigarette Market and Retail) started from raw CSV/Excel exports with inconsistent formats, blanks and duplicate rows. I ran a repeatable clean-and-model process in Power Query so the data landing in the model was trustworthy enough for executive reporting.

My Role

- Profiled each source file in Power Query — checked row counts, column data types and null/blank rates before building any visual
- Removed duplicate records, standardised date and currency formats, and split/merged columns to match the reporting grain
- Built a star-schema data model (fact + dimension tables) with clean relationships so DAX measures returned consistent totals across every page

Data Preparation Workflow

Connect & Profile → Clean & Standardize → Validate → Model & Load — the same four-stage pipeline applied consistently across all four Power BI dashboards before a single visual was built.

Data preparation workflow applied to the Insurance, Healthcare, E-Cigarette Market and Retail dashboards

Global Sporting Goods: Sales Performance Analysis

Analyzed six years (2011–2016) of global sales transactions — 113,058 orders across 6 countries and 3 product categories (Bikes, Clothing, Accessories) — to identify revenue trends and performance drivers using Excel PivotTables.

£95.0M

Total revenue, 2011–2016

£42.1M

Total profit

44.3%

Overall profit margin

113,058

Total orders

Note: the 2016 figure covers only January–July (partial year), so the apparent dip vs. 2015 reflects incomplete data coverage rather than a real decline in the business.

Global Sporting Goods: Category, Country & Product Detail

Bikes drove the majority of revenue (£69.0M), well ahead of Accessories (£16.7M) and Clothing (£9.2M); the United States and Australia were the top two markets. Road-150/200 and Mountain-200 series bikes dominate the top-10 product list by total profit — a clear signal to prioritize their stock levels and lead with them in marketing. Clothing's large gap to Bikes is worth investigating: smaller assortment, weaker marketing, or genuinely lower demand?

Global Sporting Goods: Cleaning 113K Rows Before Analysis

Objective

The raw BikeGear order export (113,058 rows, 2011–2016) had duplicate order lines, inconsistent category/country text and currency stored as text. I staged and cleaned the data in SQL Server before bringing it into Excel, so the PivotTables and charts were built on a validated, de-duplicated dataset.

Data Cleaning Steps

- Wrote T-SQL to de-duplicate order lines using ROW_NUMBER() partitioned by order, product and customer keys
- Standardised text fields (country, category casing/whitespace) and converted currency-as-text and date-as-text columns to proper DECIMAL and DATE types
- Removed void and negative-quantity transactions, then validated category totals with GROUP BY checks before exporting to Excel for PivotTable analysis

Cleaning Script (SQL Server)

Excerpt from the staging script: de-duplication, text standardisation, type fixes, void-transaction removal and a final validation query.

```

clean_bikegear_sales.sql — SQL Server

1 -- BikeGear Solutions: staging table cleaning (T-SQL)
2 -- Source: raw CSV import, 113,058 order-line rows, 2011-2016
3
4 -- 1. Remove exact duplicate order lines
5 WITH ranked AS (
6     SELECT *, ROW_NUMBER() OVER (
7         PARTITION BY OrderNumber, ProductKey, CustomerKey
8         ORDER BY OrderDate
9     ) AS rn
10    FROM stg.Sales_Raw
11 )
12 DELETE FROM ranked WHERE rn > 1;
13
14 -- 2. Standardize text fields (country, category casing/whitespace)
15 UPDATE stg.Sales_Raw
16 SET Country = UPPER(LTRIM(RTRIM(Country))),
17     Category = CASE
18         WHEN Category IN ('bike', 'Bikes ', 'BIKE') THEN 'Bikes'
19         WHEN Category IN ('accessory', 'Accessories ') THEN 'Accessories'
20         ELSE Category END;
21
22 -- 3. Fix data types: text dates -> DATE, currency text -> DECIMAL
23 ALTER TABLE stg.Sales_Raw ALTER COLUMN OrderDate DATE;
24 UPDATE stg.Sales_Raw
25 SET Revenue = CAST(REPLACE(REPLACE(Revenue, '$', ''), ',', '' ) AS DECIMAL(12,2));
26
27 -- 4. Remove void/test transactions and negative-quantity errors
28 DELETE FROM stg.Sales_Raw
29 WHERE OrderStatus = 'VOID' OR Quantity <= 0;
30
31 -- 5. Validate row counts & category totals before handoff
32 SELECT Category, COUNT(*) AS Orders, SUM(Revenue) AS TotalRevenue
33 FROM stg.Sales_Raw
34 GROUP BY Category
35 ORDER BY TotalRevenue DESC;
  
```

T-SQL staging script used to clean the BikeGear Solutions order-line export prior to Excel analysis

UK Gym Membership Retention Analysis

Analyzed 250 gym members across 5 UK regions to understand retention and churn patterns, computing status distribution, engagement levels and fee benchmarks by region in Excel.

26.8%

Active

23.6%

Completed

25.6%

Inactive

24.0%

Withdrawn

Counterintuitive finding

Withdrawn members averaged the HIGHEST monthly visit frequency (52.2 visits) of any group — churn here is not explained by declining engagement, pointing to price or life-stage factors worth investigating further.

Member Retention Status Breakdown

UK Gym Membership: Engagement & Regional Detail

Average visit frequency is similar across all four retention groups (48–52 visits/month), reinforcing that engagement alone doesn't explain churn. Average monthly fees are broadly consistent across regions, suggesting pricing is not strongly regionalized in this dataset.

UK Gym Membership: Preparing the Data for Analysis

Objective

The raw membership export needed cleaning before it could support the retention analysis: blank fields, inconsistent region labels and duplicate member records had to be resolved first. I used Power Query inside Excel to build a repeatable clean-up routine so the retention figures could be trusted.

Data Cleaning Steps

- Removed duplicate member records and blank rows; standardised region and membership-type labels
- Fixed inconsistent date formats for join dates and last-visit dates so tenure and recency could be calculated accurately
- Validated member counts by region against the source export before building the PivotTables and retention visuals

Data Preparation Workflow

Connect & Profile → Clean & Standardize → Validate → Model & Load — applied in Power Query before the retention PivotTables and visuals were built.

Data preparation workflow applied to the UK Gym Membership retention dataset

Banking Cloud Migration Gap Analysis

Background

Ham Trust Bank is an established commercial bank still running core operations on a 30-year-old on-premises mainframe. Facing rising competition from digital-only neobanks that launch products in weeks rather than months, the Board approved a strategic initiative to migrate infrastructure, applications and data to the cloud over 24 months. In this case study, I acted as Business Analyst to diagnose the current-state gaps and build the roadmap the executive committee would approve.

The Business Problem

- Legacy mainframe limits time-to-market for new products to 9–12 months, versus weeks for digital-only neobank competitors
- Customer data fragmented across 14 disconnected legacy databases, with no single view of the customer
- Mobile banking app rated just 2.9 stars; a rigid 6-week change-approval process slows every release
- Loan approvals take 10+ days across three departments on paper, versus 1–2 days at competitor banks
- New real-time transaction-monitoring regulation takes effect in 18 months — tighter than the bank's 24-month migration window

14 databases

customer data fragmented across disconnected legacy systems

9–12 months

current time-to-market for a new product, vs. weeks for digital-only competitors

My role in this case study

Business Analyst — led the gap analysis engagement: stakeholder workshops, SWOT/Fishbone/PESTLE/7S diagnosis, and the roadmap presented to the executive committee.

Diagnosing the Current State: Four Frameworks

Objective

To move beyond a list of symptoms and get to root causes, I applied four complementary diagnostic tools — SWOT, Fishbone (Ishikawa), PESTLE and McKinsey 7S — to structure the current-state assessment before building the gap matrix and roadmap.

My role in this case study

- Facilitated a SWOT session with IT, Operations and Risk & Compliance to weigh internal capability against external market pressure
- Built a Fishbone diagram to trace the root causes of HTB's competitiveness gap across People, Technology, Process, Data, Policy and Culture
- Used PESTLE and McKinsey 7S to test the roadmap against external forces and internal organisational readiness

Diagnostic Tools Applied

SWOT Analysis • Fishbone (Ishikawa) Diagram • PESTLE Analysis • McKinsey 7S Framework

The four diagnostic frameworks used to structure the Ham Trust Bank current-state assessment

Prioritised Roadmap & Recommendations

Recommended Approach

A 3-phase, 24-month roadmap: Phase 1 (Months 0–6) fast-tracks compliance and stands up the cloud foundation; Phase 2 (Months 6–14) delivers the core migration and experience uplift; Phase 3 (Months 14–24) focuses on optimisation and competitive positioning — sequenced so the highest-impact, most time-boxed gaps close first.

My role in this case study

- Facilitated diagnostic workshops with IT, Operations, Risk & Compliance and Customer Experience to surface root causes
- Applied SWOT, Fishbone, PESTLE and McKinsey 7S to structure the current-state diagnosis
- Built the current-state vs. future-state gap matrix and prioritised gaps by business impact and urgency
- Authored the 3-phase, 24-month roadmap and the recommendations pack presented to the executive committee
- Aligned the compliance fast-track (Phase 1) with the 18-month regulatory deadline for real-time monitoring

24 months

phased roadmap from foundation through optimisation

14 → 1

customer databases consolidated onto one unified cloud platform

18 months

regulatory deadline fast-tracked in Phase 1 of the roadmap

Coffee Shop Sales Analysis (PostgreSQL)

Analyzed 3,547 point-of-sale transactions from a coffee shop (March 2024 – March 2025) directly in PostgreSQL — writing queries in pgAdmin to identify best sellers, revenue drivers and sales trends across an 8-product menu.

112,246

Total revenue

3,547

Total transactions

31.65

Average transaction value

381 days

Sales history, Mar 2024 – Mar 2025

Standout finding

Americano with Milk was the top seller by volume (809 units), but Latte generated the most revenue overall (23.9% of total) — unit sales leadership and revenue leadership pointed to two different products.

Best-Selling Products by Units Sold

Coffee Shop Sales: Revenue Mix & Trend

Latte and Americano with Milk together drove 46% of revenue despite being just 2 of 8 menu items. Cumulative revenue climbed steadily to 112,246 across the 381-day sales history, with no seasonal drop-off.

Retail Orders and Product SQL Analysis

Objective

A separate SQL exercise on a retail orders/products/departments schema. Category-level questions like 'is bakery outselling alcohol?' or 'which products have zero sales and should be delisted?' are common inventory and merchandising asks — I answered them directly in SQL rather than through a BI tool, practicing joins, aggregation and NULL-handling logic.

Business Questions Answered

- Compared order volume between the Bakery and Alcohol departments using an aggregated join — the kind of category comparison a merchandising team would use to prioritize shelf space
- Identified products that had never been sold using a LEFT JOIN / IS NULL anti-join pattern, surfacing dead stock worth reviewing for delisting
- Built a full product catalogue grouped by department to support category-level reporting

Query Script (PostgreSQL)

Three queries: department order-volume comparison, unsold-product detection, and a department-grouped product catalogue.

```

retail_department_analysis.sql — PostgreSQL

1  -- Retail Orders & Departments: business-question SQL (PostgreSQL)
2  -- Tables: orders(order_id, product_id, ...), products(product_id, product_name,
3  --          department_id, ...), departments(department_id, department)
4
5  -- 1. Does the bakery department out-sell the alcohol department by order volume?
6  SELECT
7      d.department,
8      COUNT(o.order_id) AS total_sales
9  FROM orders o
10 JOIN products p
11     ON o.product_id = p.product_id
12 JOIN departments d
13     ON p.department_id = d.department_id
14 WHERE LOWER(d.department) IN ('bakery', 'alcohol')
15 GROUP BY d.department
16 ORDER BY total_sales DESC;
17
18 -- 2. Which products have never been sold?
19 SELECT
20     p.product_id,
21     p.product_name
22 FROM products p
23 LEFT JOIN orders o
24     ON p.product_id = o.product_id
25 WHERE o.product_id IS NULL
26 ORDER BY p.product_name;
27
28 -- 3. Full product catalogue grouped by department
29 SELECT
30     d.department,
31     p.product_name
32 FROM departments d
33 JOIN products p
34     ON p.department_id = d.department_id
35 ORDER BY d.department, p.product_name;

```

PostgreSQL queries answering department order-volume, unsold-product and product-catalogue questions on a retail orders dataset

THANK YOU

Let's Connect
